Contents definition: Histology embraces the wide spectrum of knowledge about microscopic architecture of cells, tissues, organs and organ systems. Given structures are observed and examined on the cellular as well as subcellular level. In the complex of medical sciences, histology lies on the notional cross-road between anatomy and physiology acting as an integrative element. Reasonably, modern histology studies the microscopic organisation of various structures in terms of functional histology that assigns this branch of knowledge to the category of dynamic sciences. Capacity of histological comprehension represents a prerequisite for other medical fields, e.g. pathological anatomy. Human embryology covers the summary of intrauterine development of a human individual.
